OAuth Pathfinder

Composio — APM, Integrations take-home · Dhiraj Chalse · 23 Oct 2026

Live app	**https://oauth-pathfinder-mu.vercel.app**
Source	**https://github.com/dhirajbit/oauth-pathfinder**
Try live	Type any app (e.g. **canva.com**, **Strava**, **Xero**) into the search box and press enter. 1–3 minutes; the agent streams every search and page it opens.

The problem I solved

A developer whose agent needs users to connect Gmail, Slack or Salesforce must register an OAuth app with that provider — and sometimes get it approved. The question nobody answers up front is **"is this a 10-minute form or a 6-week review?"** Google wants a paid CASA assessment for Gmail scopes; Dropbox freezes new links at 50 users; Salesforce stopped creating Connected Apps in Spring '26; Slack takes ten minutes. The facts exist but are scattered, and never framed as time, effort and blockers.

What I built

- **Library of 123 OAuth apps** with a triage difficulty, the one thing that decides it, and whether Composio offers a managed OAuth app (from the managed-auth directory).
- **10 full guides** across different setup challenges, researched by agents reading provider docs, then spot-checked by a person.
- **Live generation** for any app: one investigator agent (OpenAI Responses API + web search) reads the docs and writes a guide validated against the same schema.
- **Shareable without accounts**: library guides have permanent URLs; generated guides are encoded into the link itself. Copy as markdown, download JSON.

Every guide answers the same questions:

- Verdict strip — difficulty, hands-on minutes, approval wait in days, time to first token on one proportional bar
- Ordered steps, each tagged **Agent** / **Agent + you** / **You**, with portal links
- Scopes that trigger review; approval triggers, review time, what reviewers ask for, common rejections
- Nuances, blockers with workarounds, and the agent/human handoff plan
- Evidence: sources with confidence, what was confirmed on the page, what is still unverified

Demonstrated apps

App	Verdict	Why it is interesting
◆ Google Workspace	Very hard · 0–63 days	Gmail read/modify scopes are restricted: Trust & Safety review (~6 wk) + CASA assessment ($500–4,500/yr). Testing mode caps 100 users, 7-day tokens.
◆ Meta (Pages, Instagram)	Hard · 0–30 days	Per-permission App Review with screencast, Business Verification, Tech Provider verification.
◆ LinkedIn	Hard · 0–42 days	Only Sign-In and Share are self-serve; Community Management / Marketing APIs need a reviewed access request and a verified Company Page.

🔶 Salesforce	Moderate · 0–42 days	Connected Apps restricted since Spring '26 → External Client Apps; AppExchange security review only if listing.
🔶 Microsoft Graph · Dropbox · Notion	Moderate	Admin consent + publisher verification; 50-user production gate; page-sharing instead of scopes.
🟢 Slack · GitHub · HubSpot	Easy · no wait	Manifest-driven app creation; GitHub App vs OAuth App; scope/tier gating breaks HubSpot installs.
🟢 lemlist (live run)	Easy · no OAuth	The agent found there is no third-party OAuth (API keys only) and said so instead of inventing a flow. Saved in the repo as a sample output.

Evidence & verification

Spot-check of 12 consequential claims (Google, Slack, Salesforce, Dropbox) against the cited pages: **11 confirmed, 1 corrected** (Google max wait 60 → 63 days: the sum of its own cited figures), 0 unverifiable. Pattern: numbers quoted from official pages were right; derived figures and review turnarounds are where errors live, and docs are silent on exactly the things only registering an app would settle (token lifetimes, key propagation delay). Details in `VERIFICATION.md`.

Key decisions & limitations

- Time and effort are the headline, not the steps — that is what decides whether to use a managed app, pick another provider, or start the review now.
- One schema for library and live output, so the library grows by generating and reviewing rather than writing from scratch.
- No database: share links carry the guide; credential-free and permanent, at the cost of long URLs.
- Not attempted: logging into developer portals to register apps with the agent (needs real accounts and 2FA). Live guides are not person-reviewed and inherit search quality; review turnaround numbers are often community-sourced.

Stack: Next.js 16, TypeScript, Zod, OpenAI Responses API with hosted web search, Vercel. ~7 hours. No credentials in the repository.
